DETAILED ACTION

Allowable Subject Matter

Claims 1, 7-8, and 15-20 are allowed.

The following is an examiner's statement of reasons for allowance: Consider independent claims 1 and 15, the best prior arts of record found during the examination of the present application are: **Shah (USPN 2007/0060212) and Ono et al. (USPN 2004/0192412)**.

In view of the presently claimed invention, Shah discloses a power supply, a radio communication block, a first switch, a key operation section, a control unit, a base band block, an application function block, and control of the power supply to stop power to the radio communication block.

Compared to the presently claimed invention, Shah fails to disclose an application function block to which said power is always supplied from said battery through said power supply block and is possible to accomplish application functions~ at least one said application function being selectively associated with a communication involving said radio communication block; and a second switch which is interposed between said application function block and said base band block, wherein the power supply to said base band block is stopped when said control unit controls said first switch to stop the power supply from said battery to said radio communication block in response to said manual operation of said key operation section, and wherein said control unit is contained in said application function block and controls said second switch to disconnect said base band block from said application function block.

Furthermore, a second switch interposed between a base band block and a radio communication block, where application functions reside in the base band block according to another embodiment.

In view of the presently claimed invention, Ono discloses a switching means 1021 and 1025 in figs. 2 and 3 interposed between the application function processor and telephone function processor. However, the switching means regulate control and power to the I/O devices 103 and 106 and do not stop any communication between the two function processors.

Compared to the presently claimed invention, Ono fails to disclose an application function block to which said power is always supplied from said battery through said power supply block and is possible to accomplish application functions~ at least one said application function being selectively associated with a communication involving said radio communication block; and a second switch which is interposed between said application function block and said base band block, wherein the power supply to said base band block is stopped when said control unit controls said first switch to stop the power supply from said battery to said radio communication block in response to said manual operation of said key operation section, and wherein said control unit is contained in said application function block and controls said second switch to disconnect said base band block from said application function block. Furthermore, a second switch interposed between a base band block and a radio communication block, where application functions reside in the base band block according to another embodiment.

In light of the combination of the above cited references and applicant's arguments of record, the presently claimed invention is novel and non-obvious since the prior arts of record do not contain either explicitly or implicitly the limitations as a whole as recited in claims 1 and 15. In addition, any reasonable combination of the cited references cannot be used to reconstruct the claimed invention. Therefore, the present application as claimed is allowable.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
